Example 15

Antisense inhibition of human apolipoprotein B expression by chimeric phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap

5 In accordance with the present invention, a series of oligonucleotides were designed to target different regions of the human apolipoprotein B RNA, using published sequence (GenBank accession number NM_000384, incorporated herein as SEQ ID NO: 3). The oligonucleotides are shown in Table 1.

10 "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the oligonucleotide binds. All compounds in Table 1 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length, composed of a central "gap" region consisting of

15 ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine

20 residues are 5-methylcytidines. The compounds were analyzed for their effect on human apolipoprotein B mRNA levels in HepG2 cells by quantitative real-time PCR as described in other examples herein. Data are averages from two experiments. If present, "N.D." indicates "no data".

PATENT

As shown in Table 1, SEQ ID NOS 17, 18, 19, 21, 23, 25, 27, 31, 38, 43, 46, 51, 52, 53, 55, 57, 62, 63 and 66 demonstrated at least 30% inhibition of human apolipoprotein B expression in this assay and are therefore preferred. The target sites to which these preferred sequences are complementary are herein referred to as "active sites" and are therefore preferred sites for targeting by compounds of the present invention. As apolipoprotein B exists in two forms in mammals (ApoB-48 and ApoB-100) which are colinear at the amino terminus, antisense oligonucleotides targeting nucleotides 1-6530 hybridize to both forms, while those targeting nucleotides 6531-14121 are specific to the long form of apolipoprotein B.

Example 16

Antisense inhibition of human apolipoprotein B expression by chimeric phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap-Dose Response Study.

In accordance with the present invention, a subset of the antisense oligonucleotides in Example 15 were further investigated in dose-response studies. Treatment doses were 50, 150 and 250 nM. The compounds were analyzed for their effect on human apolipoprotein B mRNA levels in HepG2 cells by quantitative real-time PCR as described in other examples herein. Data are averages from two experiments and are shown in Table 2.

Example 17

Antisense inhibition of mouse apolipoprotein B expression
by chimeric phosphorothioate oligonucleotides having 2'-MOE
wings and a deoxy gap

In accordance with the present invention, a series of
oligonucleotides were designed to target different regions
of the mouse apolipoprotein B RNA, using published sequence
(GenBank accession number M35186, incorporated herein as
SEQ ID NO: 10). The oligonucleotides are shown in Table 3.

"Target site" indicates the first (5'-most) nucleotide
number on the particular target sequence to which the
oligonucleotide binds. All compounds in Table 3 are
chimeric oligonucleotides ("gapmers") 20 nucleotides in
length, composed of a central "gap" region consisting of
ten 2'-deoxynucleotides, which is flanked on both sides (5'
and 3' directions) by five-nucleotide "wings". The wings
are composed of 2'-methoxyethyl (2'-MOE) nucleotides. The
internucleoside (backbone) linkages are phosphorothioate
(P=S) throughout the oligonucleotide. All cytidine
residues are 5-methylcytidines. The compounds were
analyzed for their effect on mouse apolipoprotein B mRNA
levels in primary hepatocytes by quantitative real-time PCR
as described in other examples herein. Data are averages

5

Example 19**Western blot analysis of apolipoprotein B protein levels**

Western blot analysis (immunoblot analysis) was
carried out using standard methods. Cells were harvested
10 16-20 h after oligonucleotide treatment, washed once with
PBS, suspended in Laemmli buffer (100 ul/well), boiled for
5 minutes and loaded on a 16% SDS-PAGE gel. Gels were run
for 1.5 hours at 150 V, and transferred to membrane for
western blotting. Appropriate primary antibody directed to
15 apolipoprotein B was used, with a radiolabelled or
fluorescently labeled secondary antibody directed against
the primary antibody species. Bands were visualized using
a PHOSPHORIMAGER™ (Molecular Dynamics, Sunnyvale CA).

20 **Example 20**

**Effects of antisense inhibition of apolipoprotein B (ISIS
147764) in C57BL/6 mice: Lean animals vs. High Fat Fed
animals.**

C57BL/6 mice, a strain reported to be susceptible to
25 hyperlipidemia-induced atherosclerotic plaque formation
were used in the following studies to evaluate antisense
oligonucleotides as potential lipid lowering compounds in
lean versus high fat fed mice.

Male C57BL/6 mice were divided into two matched groups; (1) wild-type control animals (lean animals) and (2) animals receiving a high fat diet (60% kcal fat). Control animals received saline treatment and were maintained on a normal rodent diet. After overnight fasting, mice from each group were dosed intraperitoneally every three days with saline or 50 mg/kg ISIS 147764 (SEQ ID No: 109) for six weeks. At study termination and forty eight hours after the final injections, animals were sacrificed and evaluated for target mRNA levels in liver, cholesterol and triglyceride levels, liver enzyme levels and serum glucose levels.

The results of the comparative studies are shown in Table 5.

Table 5

Effects of ISIS 147764 treatment on apolipoprotein B mRNA, cholesterol, lipid, triglyceride, liver enzyme and glucose levels in lean and high fat mice.

Treatment Group	Percent Change								
	Lipoproteins						Liver Enzymes		
	mRNA	CHOL	VLDL	LDL	HDL	TRIG	AST	ALT	GLUC
Lean-control	-73	-63	No change	-64	-44	-34	Slight decrease	No change	No change
High Fat Group	-87	-67	No change	-87	-65	No change	Slight decrease	Slight increase	-28

It is evident from these data that treatment with ISIS 147764 lowered cholesterol as well as LDL and HDL lipoproteins and serum glucose in both lean and high fat mice and that the effects demonstrated are, in fact, due to the inhibition of apolipoprotein B expression as supported by the decrease in mRNA levels. No significant changes in liver enzyme levels were observed, indicating that the

ISPH-0664WO

-130-

PATENT

antisense oligonucleotide was not toxic to either treatment group.

Example 21

5 Effects of antisense inhibition of apolipoprotein B (ISIS 147764) on High Fat Fed Mice; 6 Week Timecourse Study

In accordance with the present invention, a 6-week timecourse study was performed to further investigate the effects of ISIS 147764 on lipid and glucose metabolism in
10 high fat fed mice.

Male C57BL/6 mice (n=8) receiving a high fat diet (60% kcal fat) were evaluated over the course of 6 weeks for the effects of treatment with the antisense oligonucleotide, ISIS 147764. Control animals received saline treatment (50
15 mg/kg). A subset of animals received a daily oral dose (20 mg/kg) atorvastatin calcium (Lipitor®, Pfizer Inc.). All mice, except atorvastatin-treated animals, were dosed intraperitoneally every three days (twice a week), after fasting overnight, with 5, 25, 50 mg/kg ISIS 147764 (SEQ ID
20 No: 109) or saline (50 mg/kg) for six weeks. Serum cholesterol and lipoproteins were analyzed at 0, 2 and 6 week interim timepoints. At study termination, animals were sacrificed 48 hours after the final injections and evaluated for levels of target mRNA levels in liver,
25 cholesterol, lipoprotein, triglyceride, liver enzyme (AST and ALT) and serum glucose levels as well as body, liver, spleen and fat pad weights.

Example 22

30 Effects of antisense inhibition of apolipoprotein B (ISIS 147764) in high fat fed mice- mRNA expression in liver

ISPH-0664WO

-131-

PATENT

Male C57BL/6 mice (n=8) receiving a high fat diet (60% kcal fat) were evaluated over the course of 6 weeks for the effects of ISIS 147764 on mRNA expression. Control animals received saline treatment (50 mg/kg). Mice were dosed intraperitoneally every three days (twice a week), after fasting overnight, with 5, 25, 50 mg/kg ISIS 147764 (SEQ ID No: 109) or saline (50 mg/kg) for six weeks. At study termination, animals were sacrificed 48 hours after the final injections and evaluated for levels of target mRNA levels in liver. ISIS 147764 showed a dose-response effect, reducing mRNA levels by 15, 75 and 88% at doses of 5, 25 and 50 mg/kg, respectively.

Example 23

Effects of antisense inhibition of apolipoprotein B (ISIS 147764) on serum cholesterol and triglyceride levels

Male C57BL/6 mice (n=8) receiving a high fat diet (60% kcal fat) were evaluated over the course of 6 weeks for the effects of ISIS 147764 on serum cholesterol and triglyceride levels. Control animals received saline treatment (50 mg/kg). Mice were dosed intraperitoneally every three days (twice a week), after fasting overnight, with 5, 25, 50 mg/kg ISIS 147764 (SEQ ID No: 109) or saline (50 mg/kg) for six weeks.

Serum cholesterol levels were measured at 0, 2 and 6 weeks and this data is shown in Table 6. Values in the table are expressed as percent inhibition and are normalized to the saline control.

In addition to serum cholesterol, at study termination, animals were sacrificed 48 hours after the final injections and evaluated for triglyceride levels.

Mice treated with ISIS 147764 showed a reduction in both serum cholesterol (240 mg/dL for control animals and 225, 125 and 110 mg/dL for doses of 5, 25, and 50 mg/kg, respectively) and triglycerides (115 mg/dL for control animals and 125, 150 and 85 mg/dL for doses of 5, 25, and 50 mg/kg, respectively) to normal levels by study end. These data were also compared to the effects of atorvastatin calcium at an oral dose of 20 mg/kg which showed only a minimal decrease in serum cholesterol of 20 percent at study termination.

Table 6

Percent Inhibition of mouse apolipoprotein B cholesterol levels by ISIS 147764

time	Percent Inhibition			
	Saline	5 mg/kg	25 mg/kg	50 mg/kg
0 weeks	0	0	0	0
2 weeks	0	5	12	20
6 weeks	0	10	45	55

Example 24

Effects of antisense inhibition of apolipoprotein B (ISIS 147764) on lipoprotein levels

Male C57BL/6 mice (n=8) receiving a high fat diet (60% kcal fat) were evaluated over the course of 6 weeks for the effects of ISIS 147764 on lipoprotein (VLDL, LDL and HDL) levels. Control animals received saline treatment (50 mg/kg). Mice were dosed intraperitoneally every three days (twice a week), after fasting overnight, with 5, 25, 50 mg/kg ISIS 147764 (SEQ ID No: 109) or saline (50 mg/kg) for six weeks.

Lipoprotein levels were measured at 0, 2 and 6 weeks and this data is shown in Table 7. Values in the table are expressed as percent inhibition and are normalized to the

ISPH-0664WO

-133-

PATENT

saline control. Negative values indicate an observed increase in lipoprotein levels.

These data were also compared to the effects of atorvastatin calcium at a daily oral dose of 20 mg/kg at 0, 2 and 6 weeks.

These data demonstrate that at a dose of 50 mg/kg, ISIS 147764 is capable of lowering all categories of serum lipoproteins investigated to a greater extent than atorvastatin.

10

Table 7

Percent Inhibition of mouse apolipoprotein B lipoprotein levels by ISIS 147764 as compared to atorvastatin

Lipoprotein	Time (weeks)	Percent Inhibition				
		Dose				atorvastatin (20 mg/kg)

mg/kg ISIS 147764 (SEQ ID No: 109) or saline (50 mg/kg) for six weeks.

AST and ALT levels were measured at 6 weeks and this data is shown in Table 8. Values in the table are expressed as IU/L. Increased levels of the liver enzymes ALT and AST indicate toxicity and liver damage.

Mice treated with ISIS 147764 showed no significant change in AST levels over the duration of the study compared to saline controls (105, 70 and 80 IU/L for doses of 5, 25 and 50 mg/kg, respectively compared to 65 IU/L for saline control). Mice treated with atorvastatin at a daily oral dose of 20 mg/kg had AST levels of 85 IU/L.

ALT levels were increased by all treatments over the duration of the study compared to saline controls (50, 70 and 100 IU/L for doses of 5, 25 and 50 mg/kg, respectively compared to 25 IU/L for saline control). Mice treated with atorvastatin at a daily oral dose of 20 mg/kg had AST levels of 40 IU/L.

Example 26

Effects of antisense inhibition of apolipoprotein B (ISIS 147764) on serum glucose levels

Male C57BL/6 mice (n=8) receiving a high fat diet (60% kcal fat) were evaluated over the course of 6 weeks for the effects of ISIS 147764 on serum glucose levels. Control animals received saline treatment (50 mg/kg). Mice were dosed intraperitoneally every three days (twice a week), after fasting overnight, with 5, 25, 50 mg/kg ISIS 147764 (SEQ ID No: 109) or saline (50 mg/kg) for six weeks.

At study termination, animals were sacrificed 48 hours after the final injections and evaluated for serum glucose levels. ISIS 147764 showed a dose-response effect, reducing

ISPH-0664WO

-135-

PATENT

serum glucose levels to 225, 190 and 180 mg/dL at doses of 5, 25 and 50 mg/kg, respectively compared to the saline control of 300 mg/dL. Mice treated with atorvastatin at a daily oral dose of 20 mg/kg had serum glucose levels of 215 mg/dL. These data demonstrate that ISIS 147764 is capable of reducing serum glucose levels in high fat fed mice.

Example 27

Effects of antisense inhibition of apolipoprotein B (ISIS 147764) on body, spleen, liver and fat pad weight

Male C57BL/6 mice (n=8) receiving a high fat diet (60% kcal fat) were evaluated over the course of 6 weeks for the effects of ISIS 147764 on body, spleen, liver and fat pad weight. Control animals received saline treatment (50 mg/kg). Mice were dosed intraperitoneally every three days (twice a week), after fasting overnight, with 5, 25, 50 mg/kg ISIS 147764 (SEQ ID No: 109) or saline (50 mg/kg) for six weeks.

At study termination, animals were sacrificed 48 hours after the final injections and body, spleen, liver and fat pad weights were measured. These data are shown in Table 8. Values are expressed as percent change in body weight or organ weight compared to the saline-treated control animals. Data from mice treated with atorvastatin at a daily dose of 20 mg/kg are also shown in the table. Negative values indicated a decrease in weight.

Table 8

Effects of antisense inhibition of mouse apolipoprotein B on body and organ weight

ISPH-0664WO

-136-

PATENT

	Percent Change			
	Dose			Atorvastatin 20 mg/kg
	5 mg/kg	25 mg/kg	50 mg/kg	
Total Body Wt.	5	5	-4	1
Spleen	10	10	46	10
Liver	18	70	80	15
Fat	10	6	-47	7

These data show a decrease in fat over the dosage range of ISIS 147764 counterbalanced by an increase in both spleen and liver weight with increased dose to give an overall decrease in total body weight.

Example 28

Effects of antisense inhibition of apolipoprotein B (ISIS 147764) in B6.129P-ApoE^{tm1Unc} knockout mice: Lean animals vs.

10 High Fat Fed animals.

B6.129P-ApoE^{tm1Unc} knockout mice (herein referred to as ApoE knockout mice) obtained from The Jackson Laboratory (Bar Harbor, ME), are homozygous for the ApoE^{tm1Unc} mutation and show a marked increase in total plasma cholesterol levels that are unaffected by age or sex. These animals present with fatty streaks in the proximal aorta at 3 months of age. These lesions increase with age and progress to lesions with less lipid but more elongated cells, typical of a more advanced stage of pre-atherosclerotic lesion.

The mutation in these mice resides in the apolipoprotein E (ApoE) gene. The primary role of the ApoE protein is to transport cholesterol and triglycerides throughout the body. It stabilizes lipoprotein structure, binds to the low density lipoprotein receptor (LDLR) and related proteins, and is present in a subclass of HDLs, providing them the ability to bind to LDLR. ApoE is

ISPH-0664WO

-137-

PATENT

expressed most abundantly in the liver and brain. Female B6.129P-Apoetm1Unc knockout mice (ApoE knockout mice) were used in the following studies to evaluate antisense oligonucleotides as potential lipid lowering compounds.

5 Female ApoE knockout mice ranged in age from 5 to 7 weeks and were placed on a normal diet for 2 weeks before study initiation. ApoE knockout mice were then fed *ad libitum* a 60% fat diet, with 0.15% added cholesterol to induce dyslipidemia and obesity. Control animals were
10 maintained on a high-fat diet with no added cholesterol. After overnight fasting, mice from each group were dosed intraperitoneally every three days with saline, 50 mg/kg of a control antisense oligonucleotide (ISIS 29837 TCGATCTCCTTTTATGCCCG; SEQ ID NO. 124) or 5, 25 or 50 mg/kg
15 ISIS 147764 (SEQ ID No: 109) for six weeks.

The control oligonucleotide is a chimeric oligonucleotides ("gapmers") 20 nucleotides in length, composed of a central "gap" region consisting of ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3'
20 directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines.

25 At study termination and forty eight hours after the final injections, animals were sacrificed and evaluated for target mRNA levels in liver by RT-PCR methods verified by Northern Blot analysis, glucose levels, cholesterol and lipid levels by HPLC separation methods and triglyceride
30 and liver enzyme levels (performed by LabCorp Preclinical Services; San Diego, CA). Data from ApoE knockout mice

ISPH-0664WO

-138-

PATENT

treated with atorvastatin at a daily dose of 20 mg/kg are also shown in the table for comparison.

The results of the comparative studies are shown in Table 9. Data are normalized to saline controls.

5

Table 9

10 Effects of ISIS 147764 treatment on apolipoprotein B mRNA, cholesterol, glucose, lipid, triglyceride and liver enzyme levels in ApoE knockout mice.

		Percent Inhibition				
		Dose				
		Control	5 mg/kg	25 mg/kg	50 mg/kg	atorvastatin (20 mg/kg)
mRNA		0	2	42	70	10
Glucose	Glucose Levels (mg/dL)					
		225	195	209	191	162
Cholesterol	Cholesterol Levels (mg/dL)					
		1750	1630	1750	1490	938
Lipoprotein	Lipoprotein Levels (mg/dL)					
	HDL	51	49	62	61	42
	LDL	525	475	500	325	250
	VLDL	1190	1111	1194	1113	653
Liver Enzymes	Liver Enzyme Levels (IU/L)					
	AST	55	50	60	85	75
	ALT	56	48	59	87	76

15 It is evident from these data that treatment with ISIS 147764 lowered glucose and cholesterol as well as all lipoproteins investigated (HDL, LDL and VLDL) in ApoE knockout mice. Further, these decreases correlated with a decrease in both protein and RNA levels of apolipoprotein B, demonstrating an antisense mechanism of action. No

ISPH-0664WO

-139-

significant changes in liver enzyme levels were observed, indicating that the antisense oligonucleotide was not toxic to either treatment group.

10 Example 29

Antisense inhibition of human apolipoprotein B expression by chimeric phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap: Additional Oligonucleotides

15 In accordance with the present invention, another series of oligonucleotides were designed to target different regions of the human apolipoprotein B RNA, using published sequence (GenBank accession number NM_000384.1, incorporated herein as SEQ ID NO: 3). The oligonucleotides are shown in Table 10.

Example 30**Antisense inhibition of apolipoprotein B - Gene walk**

In accordance with the present invention, a "gene walk" was conducted in which another series of oligonucleotides was designed to target the regions of the human apolipoprotein B RNA (GenBank accession number NM_000384.1, incorporated herein as SEQ ID NO: 3) which are near the target site of SEQ ID Nos 224 or 247. The oligonucleotides are shown in Table 11. "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the oligonucleotide binds. All compounds in Table 10 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length, composed of a central "gap" region consisting of ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothioate

PATENT

(P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines. The compounds were analyzed for their effect on human apolipoprotein B mRNA levels in HepG2 cells by quantitative real-time PCR as described in other examples herein. Data are averages from two experiments. If present, "N.D." indicates "no data".

apolipoprotein B expression in this assay and are therefore preferred. More preferred are SEQ ID Nos 224, 247, and 262. The target regions to which these preferred sequences are complementary are herein referred to as "preferred target segments" and are therefore preferred for targeting by compounds of the present invention. These preferred target segments are shown in Table 18. The sequences represent the reverse complement of the preferred antisense compounds shown in Tables 10 and 11. "Target site" indicates the first (5'-most) nucleotide number on the particular target nucleic acid to which the oligonucleotide binds. Also shown in Table 18 is the species in which each of the preferred target segments was found.

PATENT

binds. Also shown in Table 18 is the species in which each of the preferred target segments was found.

Example 34

- 5 Antisense inhibition of human apolipoprotein B expression by chimeric phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap - Targeting GenBank accession number AI249040.1

10 In accordance with the present invention, another series of oligonucleotides were designed to target different regions of the human apolipoprotein B RNA, using published sequence (the complement of the sequence with GenBank accession number AI249040.1, incorporated herein as SEQ ID NO: 503). The oligonucleotides are shown in Table

15 15. "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the oligonucleotide binds. All compounds in Table 15 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length, composed of a central "gap" region consisting of

20 ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine

25 residues are 5-methylcytidines. The compounds were analyzed for their effect on human apolipoprotein B mRNA levels in HepG2 cells by quantitative real-time PCR as described in other examples herein. Data are averages from two experiments. If present, "N.D." indicates "no data".

As shown in Table 15, SEQ ID Nos 505, 506, 507, 510,
5 and 512 demonstrated at least 30% inhibition of human
apolipoprotein B expression in this assay and are therefore
preferred. The target regions to which these preferred
sequences are complementary are herein referred to as
"preferred target segments" and are therefore preferred for
10 targeting by compounds of the present invention. These
preferred target segments are shown in Table 18. The
sequences represent the reverse complement of the preferred
antisense compounds shown in Table 15. "Target site"
indicates the first (5'-most) nucleotide number on the
15 particular target nucleic acid to which the oligonucleotide
binds. Also shown in Table 18 is the species in which each
of the preferred target segments was found.

Example 35

20 Antisense inhibition of human apolipoprotein B expression
by chimeric phosphorothioate oligonucleotides having 2'-MOE
wings and a deoxy gap - Variation in position of the gap

In accordance with the present invention, a series of
antisense compounds were designed to target different

ISPH-0664WO

-158-

PATENT

regions of the human apolipoprotein B RNA, using published sequences (GenBank accession number NM_000384.1, incorporated herein as SEQ ID NO: 3). The compounds are shown in Table 16. "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the compound binds. All compounds in Table 13 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length. The "gap" region consists of 2'-deoxynucleotides, which is flanked on one or both sides (5' and 3' directions) by "wings" composed of 2'-methoxyethyl (2'-MOE)nucleotides. The number of 2'-MOE nucleotides on either side of the gap varies such that the total number of 2'-MOE nucleotides always equals 10 and the total length of the chimeric oligonucleotide is 20 nucleotides. The exact structure of each oligonucleotide is designated in Table 16 as the "gap structure" and the 2'-deoxynucleotides are in bold type. A designation of 8-10-2, for instance, indicates that the first (5'-most) 8 nucleotides and the last (3'-most) 2 nucleotides are 2'-MOE nucleotides and the 10 nucleotides in the gap are 2'-deoxynucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines. The compounds were analyzed for their effect on human apolipoprotein B mRNA levels by quantitative real-time PCR as described in other examples herein. Data are averages from three experiments in which HepG2 cells were treated with the antisense oligonucleotides of the present invention at a dose of 50 nM and 150 nM. If present, "N.D." indicates "no data".

As shown in Table 16, SEQ ID Nos 224, 247, and 514
5 demonstrated at least 30% inhibition of human
apolipoprotein B expression in this assay at both doses.
These data suggest that the oligonucleotides are effective
with a number of variations in the gap placement. The
target regions to which these preferred sequences are
10 complementary are herein referred to as "preferred target
segments" and are therefore preferred for targeting by
compounds of the present invention. These preferred target
segments are shown in Table 18. The sequences represent
the reverse complement of the preferred antisense compounds
15 shown in Table 16. "Target site" indicates the first (5'-

most) nucleotide number on the particular target nucleic acid to which the oligonucleotide binds. Also shown in Table 18 is the species in which each of the preferred target segments was found.

5

Example 36

Antisense inhibition of human apolipoprotein B expression by chimeric phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap - Variation in position of the gap of
10 **SEQ ID Nos: 319 and 515**

In accordance with the present invention, a series of antisense compounds were designed based on SEQ ID Nos 319 and 515, with variations in the gap structure. The compounds are shown in Table 17. "Target site" indicates
15 the first (5'-most) nucleotide number on the particular target sequence to which the compound binds. All compounds in Table 17 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length. The "gap" region consists of 2'-deoxynucleotides, which is flanked on one or both sides (5' and 3' directions) by "wings" composed of 2'-methoxyethyl
20 (2'-MOE)nucleotides. The number of 2'-MOE nucleotides on either side of the gap varies such that the total number of 2'-MOE nucleotides always equals 10 and the total length of the chimeric oligonucleotide is 20 nucleotides. The exact
25 structure of each oligonucleotide is designated in Table 17 as the "gap structure" and the 2'-deoxynucleotides are in bold type. A designation of 8-10-2, for instance, indicates that the first (5'-most) 8 nucleotides and the last (3'-most) 2 nucleotides are 2'-MOE nucleotides and the
30 10 nucleotides in the gap are 2'-deoxynucleotides. The internucleoside (backbone) linkages are phosphorothioate (P=S) throughout the oligonucleotide. All cytidine

As shown in Table 17, SEQ ID Nos 319 and 515 demonstrated at least 44% inhibition of human apolipoprotein B expression in this assay for either dose. These data suggest that the compounds are effective with a number of variations in gap placement. The target regions to which these preferred sequences are complementary are herein referred to as "preferred target segments" and are therefore preferred for targeting by compounds of the

ISPH-0664WO

-162-

PATENT

present invention. These preferred target segments are shown in Table 18. The sequences represent the reverse complement of the preferred antisense compounds shown in Table 17. "Target site" indicates the first (5'-most) nucleotide number on the particular target nucleic acid to which the oligonucleotide binds. Also shown in Table 18 is the species in which each of the preferred target segments was found.

Table 18

Sequence and position of preferred target segments identified in apolipoprotein B.

As these "preferred target segments" have been found by experimentation to be open to, and accessible for, hybridization with the antisense compounds of the present invention, one of skill in the art will recognize or be able to ascertain, using no more than routine experimentation, further embodiments of the invention that encompass other compounds that specifically hybridize to these preferred target segments and consequently inhibit the expression of apolipoprotein B.

According to the present invention, antisense compounds include antisense oligomeric compounds, antisense oligonucleotides, ribozymes, external guide sequence (EGS) oligonucleotides, alternate splicers, primers, probes, and other short oligomeric compounds which hybridize to at least a portion of the target nucleic acid.

Antisense inhibition of human apolipoprotein B expression -
dose response of selected oligonucleotides

In accordance with the present invention, 12
5 oligonucleotides described in Examples 29 and 31 were
further investigated in a dose response study. The control
oligonucleotides used in this study were ISIS 18076 (SEQ ID
NO: 805) and ISIS 13650 (SEQ ID NO: 806).

All compounds in this study, including the controls,
10 were chimeric oligonucleotides ("gapmers") 20 nucleotides
in length, composed of a central "gap" region consisting of
ten 2'-deoxynucleotides, which is flanked on both sides (5'
and 3' directions) by five-nucleotide "wings". The wings
are composed of 2'-methoxyethyl (2'-MOE) nucleotides. The
15 internucleoside (backbone) linkages are phosphorothioate
(P=S) throughout the oligonucleotides. All cytidine
residues are 5-methylcytidines.

In the dose-response experiment, with mRNA levels as
the endpoint, HepG2 cells were treated with the antisense
20 oligonucleotides or the control oligonucleotides at doses
of 37, 75, 150, and 300 nM oligonucleotide. Data were
obtained by real-time quantitative PCR as described in
other examples herein and are averaged from two experiments
with mRNA levels in the treatment groups being normalized
25 to an untreated control group. The data are shown in Table
19.

Example 39

RNA Synthesis

In general, RNA synthesis chemistry is based on the selective incorporation of various protecting groups at strategic intermediary reactions. Although one of ordinary skill in the art will understand the use of protecting groups in organic synthesis, a useful class of protecting groups includes silyl ethers. In particular bulky silyl ethers are used to protect the 5'-hydroxyl in combination with an acid-labile orthoester protecting group on the 2'-hydroxyl. This set of protecting groups is then used with standard solid-phase synthesis technology. It is important

ISPH-0664WO

-172-

PATENT

to lastly remove the acid labile orthoester protecting group after all other synthetic steps. Moreover, the early use of the silyl protecting groups during synthesis ensures facile removal when desired, without undesired deprotection of 2' hydroxyl.

Following this procedure for the sequential protection of the 5'-hydroxyl in combination with protection of the 2'-hydroxyl by protecting groups that are differentially removed and are differentially chemically labile, RNA oligonucleotides were synthesized.

RNA oligonucleotides are synthesized in a stepwise fashion. Each nucleotide is added sequentially (3'- to 5'- direction) to a solid support-bound oligonucleotide. The first nucleoside at the 3'-end of the chain is covalently attached to a solid support. The nucleotide precursor, a ribonucleoside phosphoramidite, and activator are added, coupling the second base onto the 5'-end of the first nucleoside. The support is washed and any unreacted 5'-hydroxyl groups are capped with acetic anhydride to yield 5'-acetyl moieties. The linkage is then oxidized to the more stable and ultimately desired P(V) linkage. At the end of the nucleotide addition cycle, the 5'-silyl group is cleaved with fluoride. The cycle is repeated for each subsequent nucleotide.

Following synthesis, the methyl protecting groups on the phosphates are cleaved in 30 minutes utilizing 1 M disodium-2-carbamoyl-2-cyanoethylene-1,1-dithiolate trihydrate (S_2Na_2) in DMF. The deprotection solution is washed from the solid support-bound oligonucleotide using water. The support is then treated with 40% methylamine in water for 10 minutes at 55 °C. This releases the RNA oligonucleotides into solution, deprotects the exocyclic

ISPH-0664WO

-173-

PATENT

amines, and modifies the 2'- groups. The oligonucleotides can be analyzed by anion exchange HPLC at this stage.

The 2'-orthoester groups are the last protecting groups to be removed. The ethylene glycol monoacetate orthoester protecting group developed by Dharmacon Research, Inc. (Lafayette, CO), is one example of a useful orthoester protecting group which, has the following important properties. It is stable to the conditions of nucleoside phosphoramidite synthesis and oligonucleotide synthesis. However, after oligonucleotide synthesis the oligonucleotide is treated with methylamine which not only cleaves the oligonucleotide from the solid support but also removes the acetyl groups from the orthoesters. The resulting 2-ethyl-hydroxyl substituents on the orthoester are less electron withdrawing than the acetylated precursor. As a result, the modified orthoester becomes more labile to acid-catalyzed hydrolysis. Specifically, the rate of cleavage is approximately 10 times faster after the acetyl groups are removed. Therefore, this orthoester possesses sufficient stability in order to be compatible with oligonucleotide synthesis and yet, when subsequently modified, permits deprotection to be carried out under relatively mild aqueous conditions compatible with the final RNA oligonucleotide product.

Additionally, methods of RNA synthesis are well known in the art (Scaringe, S. A. Ph.D. Thesis, University of Colorado, 1996; Scaringe, S. A., et al., *J. Am. Chem. Soc.*, 1998, 120, 11820-11821; Matteucci, M. D. and Caruthers, M. H. *J. Am. Chem. Soc.*, 1981, 103, 3185-3191; Beaucage, S. L. and Caruthers, M. H. *Tetrahedron Lett.*, 1981, 22, 1859-1862; Dahl, B. J., et al., *Acta Chem. Scand.*, 1990, 44, 639-641; Reddy, M. P., et al., *Tetrahedron Lett.*, 1994, 25,

5 RNA antisense compounds (RNA oligonucleotides) of the present invention can be synthesized by the methods herein or purchased from Dharmacon Research, Inc (Lafayette, CO). Once synthesized, complementary RNA antisense compounds can then be annealed by methods known in the art to form double
10 stranded (duplexed) antisense compounds. For example, duplexes can be formed by combining 30 μ l of each of the complementary strands of RNA oligonucleotides (50 uM RNA oligonucleotide solution) and 15 μ l of 5X annealing buffer (100 mM potassium acetate, 30 mM HEPES-KOH pH 7.4, 2 mM
15 magnesium acetate) followed by heating for 1 minute at 90°C, then 1 hour at 37°C. The resulting duplexed antisense compounds can be used in kits, assays, screens, or other methods to investigate the role of a target nucleic acid.

20 Example 40

Design and screening of duplexed antisense compounds targeting apolipoprotein B

In accordance with the present invention, a series of nucleic acid duplexes comprising the antisense compounds of
25 the present invention and their complements can be designed to target apolipoprotein B. The nucleobase sequence of the antisense strand of the duplex comprises at least a portion of an oligonucleotide in Table 1. The ends of the strands may be modified by the addition of one or more natural or
30 modified nucleobases to form an overhang. The sense strand of the dsRNA is then designed and synthesized as the complement of the antisense strand and may also contain

ISPH-0664WO

-175-

PATENT

modifications or additions to either terminus. For example, in one embodiment, both strands of the dsRNA duplex would be complementary over the central nucleobases, each having overhangs at one or both termini.

5 For example, a duplex comprising an antisense strand having the sequence CGAGAGGCGGACGGGACCG and having a two-nucleobase overhang of deoxythymidine(dT) would have the following structure:

10 cgagaggcggacgggaccgTT Antisense Strand
 |||||
 TTgctctccgcctgccctggc Complement

RNA strands of the duplex can be synthesized by methods disclosed herein or purchased from Dharmacon Research Inc., (Lafayette, CO). Once synthesized, the complementary strands are annealed. The single strands are aliquoted and diluted to a concentration of 50 uM. Once diluted, 30 uL of each strand is combined with 15uL of a 5X solution of annealing buffer. The final concentration of said buffer is 100 mM potassium acetate, 30 mM HEPES-KOH pH 7.4, and 2mM magnesium acetate. The final volume is 75 uL. This solution is incubated for 1 minute at 90°C and then centrifuged for 15 seconds. The tube is allowed to sit for 1 hour at 37°C at which time the dsRNA duplexes are used in experimentation. The final concentration of the dsRNA duplex is 20 uM. This solution can be stored frozen (-20°C) and freeze-thawed up to 5 times.

Once prepared, the duplexed antisense compounds are evaluated for their ability to modulate apolipoprotein B expression.

When cells reached 80% confluency, they are treated with duplexed antisense compounds of the invention. For cells grown in 96-well plates, wells are washed once with

200 µL OPTI-MEM-1 reduced-serum medium (Gibco BRL) and then treated with 130 µL of OPTI-MEM-1 containing 12 µg/mL LIPOFECTIN (Gibco BRL) and the desired duplex antisense compound at a final concentration of 200 nM. After 5 hours of treatment, the medium is replaced with fresh medium. Cells are harvested 16 hours after treatment, at which time RNA is isolated and target reduction measured by RT-PCR.

Example 41

10 Design of phenotypic assays and in vivo studies for the use of apolipoprotein B inhibitors

Phenotypic assays

Once apolipoprotein B inhibitors have been identified by the methods disclosed herein, the compounds are further investigated in one or more phenotypic assays, each having measurable endpoints predictive of efficacy in the treatment of a particular disease state or condition. Phenotypic assays, kits and reagents for their use are well known to those skilled in the art and are herein used to investigate the role and/or association of apolipoprotein B in health and disease. Representative phenotypic assays, which can be purchased from any one of several commercial vendors, include those for determining cell viability, cytotoxicity, proliferation or cell survival (Molecular Probes, Eugene, OR; PerkinElmer, Boston, MA), protein-based assays including enzymatic assays (Panvera, LLC, Madison, WI; BD Biosciences, Franklin Lakes, NJ; Oncogene Research Products, San Diego, CA), cell regulation, signal transduction, inflammation, oxidative processes and apoptosis (Assay Designs Inc., Ann Arbor, MI), triglyceride accumulation (Sigma-Aldrich, St. Louis, MO), angiogenesis assays, tube formation assays, cytokine and hormone assays

ISPH-0664WO

-177-

PATENT

and metabolic assays (Chemicon International Inc., Temecula, CA; Amersham Biosciences, Piscataway, NJ).

5 In one non-limiting example, cells determined to be appropriate for a particular phenotypic assay (i.e., MCF-7 cells selected for breast cancer studies; adipocytes for obesity studies) are treated with apolipoprotein B inhibitors identified from the *in vitro* studies as well as control compounds at optimal concentrations which are determined by the methods described above. At the end of
10 the treatment period, treated and untreated cells are analyzed by one or more methods specific for the assay to determine phenotypic outcomes and endpoints.

Phenotypic endpoints include changes in cell morphology over time or treatment dose as well as changes
15 in levels of cellular components such as proteins, lipids, nucleic acids, hormones, saccharides or metals. Measurements of cellular status which include pH, stage of the cell cycle, intake or excretion of biological indicators by the cell, are also endpoints of interest.

20 Analysis of the genotype of the cell (measurement of the expression of one or more of the genes of the cell) after treatment is also used as an indicator of the efficacy or potency of the apolipoprotein B inhibitors. Hallmark genes, or those genes suspected to be associated
25 with a specific disease state, condition, or phenotype, are measured in both treated and untreated cells.

In vivo studies

The individual subjects of the *in vivo* studies
30 described herein are warm-blooded vertebrate animals, which includes humans.

ISPH-0664WO

-178-

PATENT

The clinical trial is subjected to rigorous controls to ensure that individuals are not unnecessarily put at risk and that they are fully informed about their role in the study.

5 To account for the psychological effects of receiving treatments, volunteers are randomly given placebo or apolipoprotein B inhibitor. Furthermore, to prevent the doctors from being biased in treatments, they are not informed as to whether the medication they are
10 administering is a apolipoprotein B inhibitor or a placebo. Using this randomization approach, each volunteer has the same chance of being given either the new treatment or the placebo.

Volunteers receive either the apolipoprotein B
15 inhibitor or placebo for eight week period with biological parameters associated with the indicated disease state or condition being measured at the beginning (baseline measurements before any treatment), end (after the final treatment), and at regular intervals during the study
20 period. Such measurements include the levels of nucleic acid molecules encoding apolipoprotein B or apolipoprotein B protein levels in body fluids, tissues or organs compared to pre-treatment levels. Other measurements include, but are not limited to, indices of the disease state or
25 condition being treated, body weight, blood pressure, serum titers of pharmacologic indicators of disease or toxicity as well as ADME (absorption, distribution, metabolism and excretion) measurements.

Information recorded for each patient includes age
30 (years), gender, height (cm), family history of disease state or condition (yes/no), motivation rating

ISPH-0664WO

-179-

PATENT

(some/moderate/great) and number and type of previous treatment regimens for the indicated disease or condition.

Volunteers taking part in this study are healthy adults (age 18 to 65 years) and roughly an equal number of males and females participate in the study. Volunteers with certain characteristics are equally distributed for placebo and apolipoprotein B inhibitor treatment. In general, the volunteers treated with placebo have little or no response to treatment, whereas the volunteers treated with the apolipoprotein B inhibitor show positive trends in their disease state or condition index at the conclusion of the study.

Example 42

Antisense inhibition of rabbit apolipoprotein B expression by chimeric phosphorothioate oligonucleotides having 2'-MOE wings and a deoxy gap

In accordance with the present invention, a series of oligonucleotides were designed to target different regions of rabbit apolipoprotein B, using published sequences (GenBank accession number X07480.1, incorporated herein as SEQ ID NO: 808, GenBank accession number M17780.1, incorporated herein as SEQ ID NO: 809, and a sequence was derived using previously described primers (Tanaka, *Journ. Biol. Chem.*, 1993, 268, 12713-12718) representing an mRNA of the rabbit apolipoprotein B, incorporated herein as SEQ ID NO: 810). The oligonucleotides are shown in Table 21. "Target site" indicates the first (5'-most) nucleotide number on the particular target sequence to which the oligonucleotide binds. All compounds in Table 21 are chimeric oligonucleotides ("gapmers") 20 nucleotides in length, composed of a central "gap" region consisting of

ISPH-0664WO

-180-

PATENT

ten 2'-deoxynucleotides, which is flanked on both sides (5' and 3' directions) by five-nucleotide "wings". The wings are composed of 2'-methoxyethyl (2'-MOE)nucleotides. The internucleoside (backbone) linkages are phosphorothioate

(P=S) throughout the oligonucleotide. All cytidine residues are 5-methylcytidines. The compounds were analyzed for their effect on human apolipoprotein B mRNA levels in primary rabbit hepatocytes by quantitative real-time PCR as described in other examples herein. For rabbit apolipoprotein B the PCR primers were:

forward primer: AAGCACCCCAATGTCACC (SEQ ID NO: 811)

reverse primer: GGGATGGCAGAGCCAATGTA (SEQ ID NO: 812) and

the PCR probe was: FAM- TCCTGGATTCAAGCTTCTATGTGCCTTCA -

TAMRA (SEQ ID NO: 813) where FAM (PE-Applied Biosystems, Foster City, CA) is the fluorescent reporter dye) and TAMRA (PE-Applied Biosystems, Foster City, CA) is the quencher dye. Data are averages from two experiments. If present, "N.D." indicates "no data".

10 **Example 44**

Effects of antisense inhibition of apolipoprotein B in LDLr^{-/-} mice - Dose Response

LDL receptor-deficient mice (LDLr^{-/-}) mice), a strain that cannot edit the apolipoprotein B mRNA and therefore
15 synthesize exclusively apolipoprotein B-100, have markedly elevated LDL cholesterol and apolipoprotein B-100 levels and develop extensive atherosclerosis.

LDLr^{-/-} mice, purchased from Taconic (Germantown, NY) were used to evaluate antisense oligonucleotides for
20 their potential to lower apolipoprotein B mRNA or protein levels, as well as phenotypic endpoints associated with apolipoprotein B. LDLr^{-/-} mice were separated into groups of males and females. LDLr^{-/-} mice were dosed intraperitoneally twice a week for six weeks with either
25 10, 25, or 50 mg/kg of ISIS 147764 (SEQ ID NO: 109) or ISIS 270906 (SEQ ID NO: 856) which is a 4 base mismatch of ISIS 147764, or with saline, or 20 mg/kg of Atorvastatin. At

ISPH-0664WO

-183-

PATENT

study termination animals were sacrificed and evaluated for several phenotypic markers.

ISIS 147764 was able to lower cholesterol, triglycerides, and mRNA levels in a dose-dependent manner in both male and female mice while the 4-base mismatch ISIS 270906 was not able to do this. The results of the study are summarized in Table 23.

Example 45

Effects of antisense inhibition of apolipoprotein B in Cynomolgus monkeys

Cynomolgus monkeys fed an atherogenic diet develop atherosclerosis with many similarities to atherosclerosis of human beings. Female Cynomolgus macaques share several similarities in lipoproteins and the cardiovascular system with humans. In addition to these characteristics, there

ISPH-0664WO

-184-

PATENT

are similarities in reproductive biology. The Cynomolgus female has a 28-day menstrual cycle like that of women. Plasma hormone concentrations have been measured throughout the Cynomolgus menstrual cycle, and the duration of the follicular and luteal phases, as well as plasma estradiol and progesterone concentrations across the cycle, are also remarkably similar to those in women.

Cynomolgus monkeys (male or female) can be used to evaluate antisense oligonucleotides for their potential to lower apolipoprotein B mRNA or protein levels, as well as phenotypic endpoints associated with apolipoprotein B including, but not limited to cardiovascular indicators, atherosclerosis, lipid diseases, obesity, and plaque formation. One study could include normal and induced hypercholesterolemic monkeys fed diets that are normal or high in lipid and cholesterol. Cynomolgus monkeys can be dosed in a variety of regimens, one being subcutaneously with 10-20 mg/kg of the oligomeric compound for 1-2 months. Parameters that may be observed during the test period could include: total plasma cholesterol, LDL-cholesterol, HDL-cholesterol, triglyceride, arterial wall cholesterol content, and coronary intimal thickening.

Example 46

Sequencing of Cynomolgus monkey (*Macaca fascicularis*) apolipoprotein B preferred target segment

In accordance with the present invention, a portion of the cynomolgus monkey apolipoprotein B mRNA not available in the art, was amplified. Positions 2920 to 3420 of the human apolipoprotein B mRNA sequence (GenBank accession number NM_000384.1, incorporated herein as SEQ ID NO: 3) contain the preferred target segment to which ISIS 301012

ISPH-0664WO

-185-

PATENT

hybridizes and the corresponding segment of cynomolgus monkey apolipoprotein B mRNA was amplified and sequenced. The site to which ISIS 301012 hybridizes in the human apolipoprotein B was amplified by placing primers at 5' position 2920 and 3' position 3420. The cynomolgus monkey hepatocytes were purchased from In Vitro Technologies (Gaithersburg, MD). The 500 bp fragments were produced using human and cynomolgus monkey 1° hepatocyte cDNA and were produced by reverse transcription of purified total RNA followed by 40 rounds of PCR amplification. Following gel purification of the human and cynomolgus amplicons, the forward and reverse sequencing reactions of each product were performed by Retrogen (Invitrogen kit was used to create the single-stranded cDNA and provided reagents for. Amplitaq PCR reaction). This cynomolgus monkey sequence is incorporated herein as SEQ ID NO: 855 and is 96% identical to positions 2920 to 3420 of the human apolipoprotein B mRNA.

20 Example 47

Effects of antisense inhibition of human apolipoprotein B gene (ISIS 281625 and 301012) in C57BL/6NTac-TgN(APOB100) transgenic mice

C57BL/6NTac-TgN(APOB100) transgenic mice have the human apolipoprotein B gene "knocked-in". These mice express high levels of human apolipoprotein B100 resulting in mice with elevated serum levels of LDL cholesterol. These mice are useful in identifying and evaluating compounds to reduce elevated levels of LDL cholesterol and the risk of atherosclerosis. When fed a high fat cholesterol diet, these mice develop significant foam cell accumulation underlying the endothelium and within the

media, and have significantly more complex atherosclerotic lesions than control animals.

C57BL/6NTac-TgN(APOB100) mice were divided into two groups - one group receiving oligonucleotide treatment and control animals receiving saline treatment. After overnight fasting, mice were dosed intraperitoneally twice a week with saline or 25 mg/kg ISIS 281625 (SEQ ID No: 224) or ISIS 301012 (SEQ ID No: 247) for eight weeks. At study termination and forty eight hours after the final injections, animals were sacrificed and evaluated for target mRNA levels in liver, cholesterol and triglyceride levels, and liver enzyme levels. In addition, the endogenous mouse apolipoprotein B levels in liver were measured to evaluate any effects of these antisense oligonucleotides targeted to the human apolipoprotein B.

Upon treatment with either ISIS 281625 or ISIS 301012, the AST and ALT levels were increased, yet did not exceed normal levels (~300 IU/L). Cholesterol levels were slightly increased relative to saline treatment, while triglyceride levels were slightly decreased. Treatment with either of these oligonucleotides targeted to the human apolipoprotein B which is expressed in these mice markedly decreased the mRNA levels of the human apolipoprotein, while the levels of the endogenous mouse apolipoprotein B were unaffected, indicating that these oligonucleotides exhibit specificity for the human apolipoprotein B. The results of the comparative studies are shown in Table 24.

Table 24

Example 48

Effects of antisense inhibition of apolipoprotein B (ISIS 233172, 233175, 281625, 301012, and 301027) in C57BL/6 mice

5 C57BL/6 mice, a strain reported to be susceptible to hyperlipidemia-induced atherosclerotic plaque formation were used in the following studies to evaluate the toxicity in mice of several antisense oligonucleotides targeted to human or rabbit apolipoprotein B.

10 C57BL/6 mice were divided into two groups - one group receiving oligonucleotide treatment and control animals receiving saline treatment. After overnight fasting, mice were dosed intraperitoneally twice a week with saline or 25 mg/kg of one of several oligonucleotides for two weeks.

15 The antisense oligonucleotides used in the present study were ISIS 233172 (SEQ ID NO: 835) and ISIS 233175 (SEQ ID NO: 838), both targeted to rabbit apolipoprotein B, and ISIS 281625 (SEQ ID NO: 224), ISIS 301012 (SEQ ID NO: 247), and ISIS 301027 (SEQ ID NO: 262), targeted to human

20 apolipoprotein B. At study termination and forty eight hours after the final injections, animals were sacrificed and evaluated for liver enzyme levels, body weight, liver weight, and spleen weight.

The levels of liver enzymes in mice were decreased relative to saline treatment for three of the antisense oligonucleotide. However, the rabbit oligonucleotide ISIS 233175 and the human oligonucleotide ISIS 301027 both elicited drastically increased levels of these liver enzymes, indicating toxicity. For all of the oligonucleotides tested, the change in weight of body, liver, and spleen were minor. The results of the comparative studies are shown in Table 25.

animals receiving saline treatment. After overnight fasting, mice were dosed intraperitoneally twice a week with saline or 25 mg/kg or 50 mg/kg of ISIS 281625 (SEQ ID NO: 224), ISIS 301012 (SEQ ID NO: 247), or ISIS 301027 (SEQ ID NO: 262). After 2 weeks, a blood sample was taken from the tail of the mice and evaluated for liver enzyme. After 4 weeks, and study termination, animals were sacrificed and evaluated for liver enzyme levels.

For ISIS 281625 and ISIS 301012, AST and ALT levels remained close to those of saline at either dose after 2 weeks. After 4 weeks, AST and ALT levels showed a moderate increase over saline treated animals for the lower dose, but a large increase at the higher dose. ISIS 301027, administered at either dose, showed a small increase in AST and ALT levels after 2 weeks and a huge increase in AST and ALT levels after 4 weeks. The results of the studies are summarized in Table 26.

147483 and 147764) in ob/ob mice

Ob/ob mice receiving a high fat, high cholesterol diet (60% kcal fat supplemented with 0.15% cholesterol) were treated with one of several oligonucleotides to evaluate their effect on apolipoprotein B-related phenotypic endpoints in ob/ob mice. After overnight fasting, mice from each group were dosed intraperitoneally twice a week with 50 mg/kg of ISIS 147483 (SEQ ID NO: 79), or 147764 (SEQ ID NO: 109), or the controls ISIS 116847 (SEQ ID NO: 857), or 141923 (SEQ ID NO: 858), or saline for six weeks. At study termination and forty eight hours after the final injections, animals were sacrificed and evaluated for target mRNA levels in liver, cholesterol and triglyceride levels, liver enzyme levels, serum glucose levels, and PTEN levels.

ISIS 147483 and 147764 were both able to lower apolipoprotein B mRNA levels, as well as glucose, cholesterol, and triglyceride levels. The results of the comparative studies are shown in Table 27.

What is claimed is:

1. A compound 8 to 50 nucleobases in length targeted to a nucleic acid molecule encoding apolipoprotein B, wherein said compound specifically hybridizes with and inhibits the expression of a nucleic acid molecule encoding apolipoprotein B, said compound comprising at least 8 contiguous nucleobases of any one of SEQ ID NOs: 127-134, 136, 138-174, 176-317, 319-321, 323-333, 335-339, 341-374, 376-416, 418-500, 502-510, 512-804, 815, 816, 819-821, 824, 825, 827, 828, 830, 831, 833-835, 837-839, 842, 843, and 845-854.
2. A compound 8 to 50 nucleobases in length which specifically hybridizes with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding apolipoprotein B, said compound comprising at least 8 contiguous nucleobases of any one of SEQ ID NOs: 127-134, 136, 138-174, 176-317, 319-321, 323-333, 335-339, 341-374, 376-416, 418-500, 502-510, 512-804, 815, 816, 819-821, 824, 825, 827, 828, 830, 831, 833-835, 837-839, 842, 843, and 845-854, said active site being a region in said nucleic acid wherein binding of said compound to said site significantly inhibits apolipoprotein B expression as compared to a control.
3. A compound 8 to 50 nucleobases in length targeted to a nucleic acid molecule encoding apolipoprotein B, wherein said compound specifically hybridizes with said nucleic acid and inhibits expression of apolipoprotein B, wherein the apolipoprotein B is encoded by a polynucleotide selected from the group consisting of: (a) SEQ ID NO: 3 and (b) a naturally occurring variant apolipoprotein B-encoding

ISPH-0664WO

-192-

PATENT

polynucleotide that hybridizes to the complement of the polynucleotide of (a) under stringent conditions, said compound comprising at least 8 contiguous nucleobases of any one of SEQ ID NOs: 127-134, 136, 138-174, 176-317, 319-321, 323-333, 335-339, 341-374, 376-416, 418-500, 502-510, 512-804, 815, 816, 819-821, 824, 825, 827, 828, 830, 831, 833-835, 837-839, 842, 843, and 845-854.

4. A compound 8 to 50 nucleobases in length targeted to a nucleic acid molecule encoding apolipoprotein B, wherein said compound specifically hybridizes with said nucleic acid and inhibits expression of apolipoprotein B, wherein the apolipoprotein B is encoded by a polynucleotide selected from the group consisting of SEQ ID NO: 3 and SEQ ID NO: 17, said compound comprising at least 8 contiguous nucleobases of any one of SEQ ID NOs: 127-134, 136, 138-174, 176-317, 319-321, 323-333, 335-339, 341-374, 376-416, 418-500, 502-510, 512-804, 815, 816, 819-821, 824, 825, 827, 828, 830, 831, 833-835, 837-839, 842, 843, and 845-854.

5. A compound 8 to 50 nucleobases in length targeted to a nucleic acid molecule encoding apolipoprotein B, wherein said compound specifically hybridizes with an active site in said nucleic acid and inhibits expression of apolipoprotein B, said compound comprising at least 8 contiguous nucleobases of any one of SEQ ID NOs: 127-134, 136, 138-174, 176-317, 319-321, 323-333, 335-339, 341-374, 376-416, 418-500, 502-510, 512-804, 815, 816, 819-821, 824, 825, 827, 828, 830, 831, 833-835, 837-839, 842, 843, and 845-854, said active site being a region in said nucleic acid wherein binding of said compound to said site

significantly inhibits apolipoprotein B expression as compared to a control.

6. An oligonucleotide mimetic compound 8 to 50 nucleobases in length targeted to a nucleic acid molecule encoding apolipoprotein B, wherein said compound specifically hybridizes with said nucleic acid and inhibits expression of apolipoprotein B, said compound comprising at least 8 contiguous nucleobases of any one of SEQ ID NOs: 127-134, 136, 138-174, 176-317, 319-321, 323-333, 335-339, 341-374, 376-416, 418-500, 502-510, 512-804, 815, 816, 819-821, 824, 825, 827, 828, 830, 831, 833-835, 837-839, 842, 843, and 845-854.

7. The compound of any one of claims 1-6 targeted to a nucleic acid molecule encoding apolipoprotein B, wherein said compound specifically hybridizes with and inhibits expression of the long form of apolipoprotein B, ApoB-100.

8. The compound of any one of claims 1-7, wherein said compound specifically hybridizes with said nucleic acid and inhibits expression of mRNA encoding apolipoprotein B by at least 5% in 80% confluent HepG2 cells in culture at an optimum concentration.

9. The compound of claim 8 wherein the compound inhibits expression of mRNA encoding apolipoprotein B by at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, or at least 50%.

10. The compound of any one of claims 1-9 which is an antisense oligonucleotide.

ISPH-0664WO

-194-

PATENT

11. The compound of any one of claims 1-10 wherein the antisense oligonucleotide has a sequence comprising SEQ ID NO: 224.

12. The compound of any one of claims 1-10 wherein the antisense oligonucleotide hybridizes with a region complementary to SEQ ID NO: 224.

13. The compound of any one of claims 1-10 comprising SEQ ID NO: 224.

14. The compound of any one of claims 1-10 consisting essentially of SEQ ID NO: 224.

15. The compound of any one of claims 1-10 consisting of SEQ ID NO: 224.

16. The compound of any one of claims 1-10 wherein the antisense oligonucleotide has a sequence comprising SEQ ID NO: 247.

17. The compound of any one of claims 1-10 wherein the antisense oligonucleotide hybridizes with a region complementary to SEQ ID NO: 247.

18. The compound of any one of claims 1-10 comprising SEQ ID NO: 247.

19. The compound of any one of claims 1-10 consisting essentially of SEQ ID NO: 247.

20. The compound of any one of claims 1-10 consisting of SEQ ID NO: 247.

21. The compound of any one of claims 1-10 wherein the antisense oligonucleotide has a sequence comprising SEQ ID NO: 319.

22. The compound of any one of claims 1-10 wherein the antisense oligonucleotide hybridizes with a region complementary to SEQ ID NO: 319.

23. The compound of any one of claims 1-10 comprising SEQ ID NO: 319.

24. The compound of any one of claims 1-10 consisting essentially of SEQ ID NO: 319.

25. The compound of any one of claims 1-10 consisting of SEQ ID NO: 319.

26. The compound of any one of claims 1-25 wherein the antisense oligonucleotide comprises at least one modified internucleoside linkage.

27. The compound of claim 26 wherein the modified internucleoside linkage is a phosphorothioate linkage.

28. The compound of any one of claims 1-27 wherein the antisense oligonucleotide comprises at least one modified sugar moiety.

29. The compound of claim 28 wherein the modified sugar moiety is a 2'-O-methoxyethyl sugar moiety.

30. The compound of any one of claims 1-29 wherein the

antisense oligonucleotide comprises at least one modified nucleobase.

31. The compound of claim 30 wherein the modified nucleobase is a 5-methylcytosine.

32. The compound of any one of claims 1-31 wherein the antisense oligonucleotide is a chimeric oligonucleotide.

33. A composition comprising the compound of any one of claims 1-32 and a pharmaceutically acceptable carrier or diluent.

34. The composition of claim 33 further comprising a colloidal dispersion system.

35. The composition of claim 33 or 34 wherein the compound is an antisense oligonucleotide.

36. A method of inhibiting the expression of apolipoprotein B in cells or tissues comprising contacting said cells or tissues with the compound of any one of claims 1-32 so that expression of apolipoprotein B is inhibited.

37. A method of treating an animal having a disease or condition associated with apolipoprotein B comprising administering to said animal a therapeutically or prophylactically effective amount of the compound of claims 1-32 so that expression of apolipoprotein B is inhibited.

38. The method of claim 37 wherein the condition is associated with abnormal lipid metabolism.

39. The method of claim 37 wherein the condition is associated with abnormal cholesterol metabolism.

40. The method of claim 37 wherein the condition is atherosclerosis.

41. The method of claim 37 wherein the condition is an abnormal metabolic condition.

42. The method of claim 41 wherein the abnormal metabolic condition is hyperlipidemia.

43. The method of claim 37 wherein the disease is diabetes.

44. The method of claim 43 wherein the diabetes is Type 2 diabetes.

45. The method of claim 37 wherein the condition is obesity.

46. The method of claim 37 wherein the disease is cardiovascular disease.

47. A method of modulating glucose levels in an animal comprising administering to said animal the compound of claims 1-32.

48. The method of claim 47 wherein the animal is a human.

49. The method of claim 47 wherein the glucose levels are plasma glucose levels.

50. The method of claim 47 wherein the glucose levels are serum glucose levels.

51. The method of claim 47 wherein the animal is a diabetic animal.

52. A method of preventing or delaying the onset of a disease or condition associated with apolipoprotein B in an animal comprising administering to said animal a therapeutically or prophylactically effective amount of the compound of claims 1-32.

53. The method of claim 52 wherein the animal is a human.

54. The method of claim 52 wherein the condition is an abnormal metabolic condition.

55. The method of claim 52 wherein the abnormal metabolic condition is hyperlipidemia.

56. The method of claim 52 wherein the disease is diabetes.

57. The method of claim 56 wherein the diabetes is Type 2 diabetes.

58. The method of claim 52 wherein the condition is obesity.

59. The method of claim 52 wherein the condition is atherosclerosis.

60. The method of claim 52 wherein the condition involves abnormal lipid metabolism.

61. The method of claim 52 wherein the condition involves abnormal cholesterol metabolism.

62. A method of preventing or delaying the onset of an increase in glucose levels in an animal comprising administering to said animal a therapeutically or prophylactically effective amount of the compound of claims 1-32.

63. The method of claim 62 wherein the animal is a human.

64. The method of claim 62 wherein the glucose levels are serum glucose levels.

65. The method of claim 62 wherein the glucose levels are plasma glucose levels.

66. A method of modulating serum cholesterol levels in an animal comprising administering to said animal a therapeutically or prophylactically effective amount of the compound of claims 1-32.

67. The method of claim 66 wherein the animal is a human.

68. A method of modulating lipoprotein levels in an animal comprising administering to said animal a therapeutically or prophylactically effective amount of the compound of claims 1-32.

69. The method of claim 69 wherein the animal is a human.

70. The method of claim 68 wherein the lipoprotein is VLDL.

71. The method of claim 68 wherein the lipoprotein is HDL.

72. The method of claim 68 wherein the lipoprotein is LDL.

73. A method of modulating serum triglyceride levels in an animal comprising administering to said animal a therapeutically or prophylactically effective amount of the compound of claims 1-32.

74. The method of claim 73 wherein the animal is a human.

75. The compound of any one of claims 1-32, wherein said compound specifically hybridizes with and inhibits the expression of a nucleic acid molecule encoding an alternatively spliced form of apolipoprotein B.

76. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of a disease or condition associated with apolipoprotein B expression.

77. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of a condition associated with abnormal lipid metabolism.

78. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of a condition associated with abnormal cholesterol metabolism.

79. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of atherosclerosis.

80. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of hyperlipidemia.

81. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of diabetes.

82. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of Type 2 diabetes.

83. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of obesity.

84. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the treatment of cardiovascular disease.

85. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for preventing or delaying the onset of increased glucose levels.

86. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for preventing or delaying the onset of increased serum glucose levels.

87. Use of a compound of any one of claims 1-32 for the

manufacture of a medicament for preventing or delaying the onset of increased plasma glucose levels.

88. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the modulation of serum cholesterol levels.

89. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the modulation of serum lipoprotein levels.

90. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the modulation of serum VLDL levels.

91. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the modulation of serum HDL levels.

92. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the modulation of serum LDL levels.

93. Use of a compound of any one of claims 1-32 for the manufacture of a medicament for the modulation of serum triglyceride levels.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US03/15493

A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) : C07H 21/04

US CL : 536/23.1, 24.3, 24.31, 24/33, 24.5

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 536/23.1, 24.3, 24.31, 24/33, 24.5

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Please See Continuation Sheet

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	WO 01/12789 A2 (CHAN et al.) 22 February 2001 (22.02.2001), page 2, lines 15-27.	1-7

☐ Further documents are listed in the continuation of Box C.

☐ See patent family annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"B" earlier application or patent published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

16 October 2003 (16.10.2003)

Date of mailing of the international search report

22 OCT 2003

Name and mailing address of the ISA/US

Mail Stop PCT, Attn: ISA/US
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450

Facsimile No. (703)305-3230

Telephone No. 703-308-0196

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US03/15493

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claim Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☒ Claim Nos.: 8-93
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐
☐

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT
